**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

ddalecki@wenderoth.com  
coa@wenderoth.com

1                   *The above-entitled matter came on for hearing on Tuesday,*  
2                   *February 1, 2011, commencing at 10:35 a.m., at the U.S. Patent and*  
3                   *Trademark Office, 600 Dulany Street, 9th Floor, Alexandria, Virginia,*  
4                   *before Kevin E. Carr, Notary Public.*

5

6                   THE CLERK: Calendar No. 4, Appeal No. 2010-003574, Mr.  
7                   Jacob.

8                   JUDGE GARRIS: Thank you.

9                   Good morning, Mr. Jacob.

10                  MR. JACOB: Good morning, Your Honors.

11                  JUDGE GARRIS: Do you have a business card you could give  
12                  our reporter, please?

13                  MR. JACOB: Possibly. Just to help with spelling and what  
14                  not.

15                  What kind of lawyer is this? No business card, I don't see one  
16                  here. I'm sorry.

17                  JUDGE GARRIS: Oh, that's all right. I believe if you could  
18                  just spell your last name?

19                  MR. JACOB: Yeah, J-a-c-o-b, first name Matthew,  
20                  M-a-t-t-h-e-w.

21                  JUDGE GARRIS: All right, sir. As you know, you have about  
22                  20 minutes. Please begin.

23                  MR. JACOB: I would request, if possible, an extra five  
24                  minutes, because there's a lot of issues to discuss.

1 JUDGE GARRIS: Maybe not that many issues are necessary.  
2 But we'll play that by ear, and see how it goes.

3 MR. JACOB: Okay. Thank you.

4 Okay. So this is an appeal from the final rejection of Claims 6  
5 to 9. The remaining claims 10 and 11 are withdrawn.

6 Main Claim 6 is directed to a single-wall carbon nanohorn.  
7 We're dealing in the area of nanochemistry and nanohorns, nanotubes, and  
8 fullerenes are the common nano materials that we deal with.

9 Anyway, this is a single-wall nanohorn, having methane  
10 absorbtivity, in which a lanthanide metal is deposited on the nanohorn.

11 A single-wall nanohorn is basically a carbon nanotube, that has  
12 a horn-like structure at the end of it. So if my arm is the tube, this would be  
13 the nanohorn. Just the arm alone would be the tube.

14 Fullerenes are basically BuckyBalls or spheres. This will come  
15 up in a few moments.

16 On pages one to three of the specification, it disclosed that our  
17 nanohorns are particularly capable of absorbing methane, in comparison to  
18 other carbon forms or allotropes, which are known to absorb methane.

19 The claimed lanthanide metal nanohorn, we show, is 50 percent  
20 better in methane absorption than the nanohorn without the lanthanum. And  
21 that's at page eight, lines 1 to 9 of the speculum.

22 Claims 6 to 9 were rejected under 103, as unpatentable over  
23 Kawamura US 6706431. Kawamura discloses that fullerenes, nanotubes,

1 nanohorns, nanofibers, and metal encapsulated fullerenes, alone or  
2 combined, form electrodes suitable to store hydrogen in a fuel cell.

3 As metals they mention platinum group metals and several  
4 others, but they really don't mention lanthanum, per se. This may be subject  
5 to debate, but looking at the Kawamura reference, lanthanide, lanthanum is  
6 not listed as a hydrogen-absorbing material.

7 And we would argue that it's not disclosed as part of a  
8 metal-encapsulated fullerene to be used in Kawamura's invention.

9 The first theory of the rejection is that since Kawamura  
10 discloses nanohorns and fullerenes, in other words, the sphere and the horn,  
11 and some others, and you can use them singly or combined;

12 So the first theory of the rejection is that if you have a mixture  
13 and you glue them together to form an electrode, it would cause the  
14 nanohorns and the metal-encapsulated fullerenes to contact each other.

15 Now the metal in Kawamura is inside, it's encapsulated in the  
16 fullerene. And you can see that from Kawamura, column 4, lines 48 and 49.

17 And it's not directly deposited on or available to directly contact  
18 the nanohorn.

19 Now our claim says that the lanthanide metal is deposited on  
20 the nanohorn. So what does deposited on mean? I guess you'd give it the  
21 broadest reasonable interpretation to one of ordinary skill in the art.

22 A lanthanide that is encapsulated by the fullerene is not  
23 available to be deposited on. It's within the fullerene. And I guess the  
24 Examiner is saying that it doesn't have to be deposited; if it contacts

1 somehow, even though it's separated within the fullerene, the metal is still  
2 deposited on the horn;

3 Which I think is contrary to what we say in our spec, and what  
4 any reasonable person skilled in the art in the field of absorption chemistry  
5 or nanochemistry would expect.

6 The board might want to take a look at MPEP 2111.01 on plain  
7 meaning. And we think that the Examiner's interpretation of "deposited on"  
8 is contrary to the plain meaning of the word.

9 Kawamura mentions carbon allotropes in combination; but he  
10 doesn't actually disclose a mixture of lanthanum metal-encapsulated  
11 fullerenes with carbon nanohorns.

12 So you need to pick and choose from among the many carbon  
13 allotropes disclosed by Kawamura and the many metals that can be within a  
14 metal-encapsulated fullerene to come to what the Examiner says, not what  
15 we have.

16 It's not what we have.

17 Kawamura does mention lanthanum-encapsulated fullerenes,  
18 such as lanthanum carbon 82 in column four, lines 37 to 49.

19 But it doesn't really appear that that's part of his invention. It's  
20 just some background explaining what a metal-encapsulated fullerene is.

21 So it takes a large stretch of imagination and hindsight to find  
22 or to single out from Kawamura a lanthanum deposited nanohorn with the  
23 lanthanum deposited on the surface of the nanohorn.

1           His next theory of rejection is that the nanohorn agglomerates  
2 when you mix the nanohorn, if you mix a nanohorn with a  
3 metal-encapsulated fullerene, it will somehow agglomerate, and there will be  
4 enough of the lanthanum peaking through the metal-encapsulated fullerene  
5 to be deposited on and interact with the nanohorn, because the Examiner  
6 says nanohorns have an open-caged structure, which would permit this.

7           Well, what proof does the Examiner present to support his  
8 theory about the openness of the structure of fullerenes? How open is the  
9 structure and is it open enough to permit the lanthanide encapsulated inside  
10 to peek outside and somehow contact the nanohorn, that it might be mixed  
11 with?

12           We think not.

13           The Examiner's theory is apparently based on inherency, but  
14 inherency according to MPEP 2112 states that it's insufficient data result  
15 may occur, it must occur.

16           And we don't see how it must be the case that the lanthanum,  
17 even if lanthanum is encapsulated within fullerenes, and even if it's mixed  
18 with nanohorns, that the lanthanum would be deposited in the fullerene,  
19 maybe deposited on the nanohorn.

20           We argue separately with respect to Claim 7, which requires a  
21 specific amount of lanthanum metal to be deposited on the nanohorn. The  
22 Examiner says it would be within the skill of the art to optimize the amount  
23 of the lanthanum metal, in order to optimize the catalytic effect of the  
24 carbon;

1                   But we don't know what catalytic effect. I mean, we're dealing  
2 with absorbents, basically here. We want to absorb methane.

3                   And how to achieve or enable this level of contact, when the  
4 metal of Kawamura doesn't even contact the nanohorn.

5                   So in other words, you have this ball with the lanthanum inside,  
6 and perhaps it could be mixed with the nanohorn, and the metal inside will  
7 somehow peak out or somehow interact with the nanohorn.

8                   So the metal is encapsulated in the fullerene, the sphere, and  
9 somehow if it's mixed with the nanohorn, might somehow touch it.

10                  The Kawamura reference sheds a little light on that possibility  
11 of the structure being open enough to permit this contact.

12                  Kawamura says in Column 4, starting at line 44, "The  
13 characteristic of fullerenes are known to produce doping alkaloid" -- I think  
14 they mean alkaline -- "metal between the frames of M3C60, where M is an  
15 alkaloid metal, such as potassium or rubidium" -- these of course, alkaline  
16 metals -- "and to encapsulate such metals as lanthanum and calcium in the  
17 form of compounds like LAC82, LA2C82, and C60."

18                  So it appears that if there's anything peaking through the  
19 structure, it's a rather porous, open structure. But it's porous in relative  
20 terms, meaning very fine openings.

21                  So if you have the sphere, the BuckyBall, with tiny openings,  
22 it's the potassium and rubidium alkaline metals that are in the interstices;

23                  But the plain meaning of encapsulated is: Within. So it's the  
24 lanthanum that is totally within the fullerene.

1               So in Claim 9, we further require that the metal be lanthanum,  
2 the lanthanide metal be one of several actual lanthanide metals.

3               And as I said, there's no actual teaching of using LA,  
4 lanthanum, as a metal-encapsulated fullerene in Kawamura, and certainly not  
5 to contact the nanohorn disclosed by Kawamura.

6               In other words, there's many possibilities, many permutations  
7 and combinations, and it would take a great stretch of imagination and  
8 complete hindsight reconstruction of our invention to pull out lanthanide  
9 metal contacting a carbon nanohorn from Kawamura's disclosure.

10              So basically Kawamura is not even enabling for any particular  
11 amount of lanthanide metal being deposited on their carbon nanohorn;  
12 because it's trapped inside the ball, so how can you control the amount that's  
13 actually deposited on the nanohorn?

14              So it's a rather speculative interpretation, at best. And as we  
15 said, "deposited," we believe it means "contact." And that's the normal use  
16 of the word, and it doesn't mean buried in something else, which in turn  
17 contacts or may contact the carbon nanohorn.

18              So for the reasons I've given, I request a reversal of the exam as  
19 rejection.

20              And I guess I don't need that extra time.

21              JUDGE GARRIS: No questions? Any questions?

22              (Discussion was held off the record.)

23              JUDGE GARRIS: Sir, thank you very much for coming in, and  
24 helping us with this case.

Appeal 2010-003574  
Application 10/560,808

1                   MR. JACOB: Thank you.  
2                   (Whereupon, at 10:53 a.m., the proceedings were concluded.)
